

LISTING OF THE CLAIMS

Claims 27-64 are pending in the instant application. The Applicant requests reconsideration of the claims in view of the amendments to the claims and following remarks.

Listing of claims:

Claims 1-26 (Canceled).

Claim 27 (Previously presented): A system for acoustical communication comprising:

an eyeglass frame having a plurality of directionally dependent microphones to capture one or more voice signals;

a transmitter configured to transmit said one or more captured voice signals to one or more external electronic devices; and

a control module configured to adjust directional dependence of at least a first directionally dependent microphone of said plurality of directionally dependent microphones based on said one or more voice signals captured by said first directionally dependent microphone and at least a second directionally dependent microphone of said plurality of directionally dependent microphones, wherein said second directionally dependent microphone is located on an ear engaging portion of said eyeglass frame for capturing bodily vibration sound waves.

Claim 28 (Previously presented): The system for acoustical communication according to claim 27, wherein said second directionally dependent microphone is a contact microphone.

Claim 29 (Previously presented): The system for acoustical communication according to claim 27, wherein said one or more voice signals captured by said first directionally dependent microphone are filtered by said control module based on said one or more voice signals captured by a third directionally dependent microphone.

Claim 30 (Previously presented): The system for acoustical communication according to claim 27, comprising an amplifier controlled by one or more voice signals captured by a third directionally dependent microphone.

Claim 31 (Previously presented): The system for acoustical communication according to claim 27, wherein said one or more voice signals captured by a directionally dependent microphone are processed based on reference filters.

Claim 32 (Previously presented): The system for acoustical communication according to claim 27, wherein at least one directionally dependent microphone is included in at least one microphone array.

Claim 33 (Previously presented): The system for acoustical communication according to claim 32, wherein said at least one microphone array is implemented in MEMS technology.

Claim 34 (Previously presented): The system for acoustical communication according to claim 27, wherein said one or more external electronic devices comprises a mobile radio device.

Claim 35 (Previously presented): The system for acoustical communication according to claim 27, wherein said eyeglass frame comprises a retinal scanning display.

Claim 36 (Previously presented): The system for acoustical communication according to claim 35, wherein said eyeglass frame comprises a direction module configured to capture a direction of view.

Claim 37 (Previously presented): The system for acoustical communication according to claim 27, comprising a speech recognition module configured to capture spoken commands via at least one directionally dependent microphone.

Claim 38 (Previously presented): The system for acoustical communication according to claim 27, comprising: at least one of: Bluetooth, ZigBee, GSM and UMTS interfaces.

Claim 39 (Previously presented): The system for acoustical communication according to claim 27, wherein said eyeglass frame comprises photovoltaic cells configured to supply power.

Claim 40 (Previously presented): A method for acoustical communication, comprising:

capturing one or more voice signals via a plurality of directionally dependent microphones;

transmitting, via a wireless interface, said one or more captured voice signals to one or more external devices;

adjusting, via a control module, directional dependence of at least a first directionally dependent microphone of said plurality of directionally dependent microphones based on said one or more voice signals captured by said first directionally dependent microphone and at least [[one]] a second directionally dependent microphone of said plurality of directionally dependent microphones; wherein said second directionally dependent microphone is positioned for capturing bodily vibration sound waves.

Claim 41 (Previously presented): The method for acoustical communication according to claim 40, wherein second directionally dependent microphone is a contact microphone.

Claim 42 (Previously presented): The method for acoustical communication according to claim 40, comprising filtering said one or more voice signals captured by said first directionally dependent microphone based on said one or more voice signals captured by a third directionally dependent microphone.

Claim 43 (Previously presented): The method for acoustical communication according to claim 40, comprising controlling an amplifier with said one or more voice signals captured by a third directionally dependent microphone.

Claim 44 (Previously presented): The method for acoustical communication according to claim 40, comprising processing said one or more voice signals captured by a directionally dependent microphone based on reference filters.

Claim 45 (Previously presented): The method for acoustical communication according to claim 40, wherein said at least one directionally dependent microphone is included in at least one microphone array.

Claim 46 (Previously presented): The method for acoustical communication according to claim 45, wherein said at least one microphone array is implemented in MEMS technology.

Claim 47 (Previously presented): The method for acoustical communication according to claim 40, comprising transmitting said one or more captured voice signals to a mobile radio device.

Claim 48 (Previously presented): The method for acoustical communication according to claim 40, comprising projecting image data onto a retina via a retinal scanning display.

Claim 49 (Previously presented): The method for acoustical communication according to claim 48, comprising capturing, via a module, a direction of view.

Claim 50 (Previously presented): The method for acoustical communication according to claim 40, comprising capturing spoken commands via a speech recognition module.

Claim 51 (Previously presented): The method for acoustical communication according to claim 40, comprising transmitting said one or more captured voice signals to said one or more external devices via at least one of: Bluetooth, ZigBee, GSM and a UMTS interface.

Claim 52 (Previously presented): The method for acoustical communication according to claim 40, comprising: providing power via a power supply of photovoltaic cells.

Claim 53 (Previously presented): A system for acoustical communication comprising:

an eyeglass frame having a plurality of recording means for capturing one or more voice signals;

communication means for transmitting said one or more captured voice signals to one or more external electronic devices;

control means for dynamically adjusting directional dependence of at least a first recording means of the plurality of recording means based on said one or more voice signals captured by said first recording means and at least a second recording means of said plurality of recording means; and

ear engagement means for holding said second recording means for capturing bodily vibration sound waves.

Claim 54 (Previously presented): The system for acoustical communication according to claim 27, wherein said control module adjusts a position of at least said first directionally dependent microphone based on said one or more voice signals captured by said first directionally dependent microphone and at least a second directionally dependent microphone of the plurality of directionally dependent microphones.

Claim 55 (Previously presented): A system for acoustical communication, said system comprising:

a plurality of directionally dependent microphones to capture one or more voice signals;

a transmitter configured to transmit said one or more captured voice signals to one or more external electronic devices; and

a control module configured to adjust directional dependence of at least a first directionally dependent microphone of said plurality of directionally dependent microphones based on said one or more voice signals captured by said first directionally dependent microphone and at least a second directionally dependent microphone of said plurality of directionally dependent microphones, wherein said second directionally dependent microphone is positioned for capturing bodily vibration sound waves.

Claim 56 (Previously presented): The system for acoustical communication according to claim 55, wherein said second directionally dependent microphone is a contact microphone.

Claim 57 (Previously presented): The system for acoustical communication according to claim 55, wherein said one or more voice signals captured by said first directionally dependent microphone are filtered by said control module based on

said one or more voice signals captured by a third directionally dependent microphone.

Claim 58 (Previously presented): The system for acoustical communication according to claim 55, comprising an amplifier controlled by one or more voice signals captured by a third directionally dependent microphone.

Claim 59 (Previously presented): The system for acoustical communication according to claim 55, wherein said one or more voice signals captured by a directionally dependent microphone are processed based on reference filters.

Claim 60 (Previously presented): The system for acoustical communication according to claim 55, wherein at least one directionally dependent microphone is included in at least one microphone array.

Claim 61 (Previously presented): The system for acoustical communication according to claim 60, wherein said at least one microphone array is implemented in MEMS technology.

Claim 62 (Previously presented): The system for acoustical communication according to claim 55, wherein said one or more external electronic devices comprises a mobile radio device.

Claim 63 (Previously presented): The system for acoustical communication according to claim 55, comprising a speech recognition module configured to capture spoken commands via at least one directionally dependent microphone.

Claim 64 (Previously presented): The system for acoustical communication according to claim 55, comprising: at least one of: Bluetooth, ZigBee, GSM and UMTS interfaces.
